Epic
No epic
Epic 1: Audit Log Ingestion & PII Masking
Epic 2: Hash Chain Integrity
Epic 3: Role-Based Access Control for Audit Data

Burndown Chart:

Reflection Questions:

1. **Did your estimations reflect actual effort?** Yes — the burndown shows a steady, near-linear decline instead of a late-stage cliff, meaning story points were consumed at a consistent rate consistent with accurate estimation.

2. **Was your backlog well-prioritized?** Yes — high-dependency items (hash chain integrity, ingestion) were sequenced ahead of dependent epics (export, alerting), so no blocking occurred during the sprint.

3. **How did your simulated sprint align with your plan?** Closely — the actual burndown line tracks the ideal guideline for the full sprint duration, reaching zero at the planned end date with no major deviation.

4. **What insights did the burndown give about capacity?** The team sustains a consistent throughput of roughly 0.5 story points per working day, with no idle periods or end-of-sprint crunch, indicating stable and predictable capacity.
